

Dear Valued Customer,

Send your organic, oil or petroleum samples to our laboratory for

FLASH POINT TESTING (ASTM D 93)

What is Flash Point?

Flash point is defined as the lowest temperature of a liquid at which its vapors will form a combustible mixture with air. Flash point is a convenient and reliable classification of flammability for numerous petroleum liquids and related substances.

** American National Standards Institute (ANSI)*

The test can help you to assess the ignitability or flammability of materials/wastes. The flash point of the material is also used in the shipping and safety regulations to define the flammability and combustibility of materials/wastes.

Our laboratory is equipped with Pensky Marten Closed Cup Apparatus
for Flash Point Test
